

Title Slide

01

- Project: FintechHQ
- AI-Enabled Financial Intelligence, Analytics, and Paper Trading Platform
- 2026 presentation edition

Project Vision

- Build a unified fintech platform for secure access, market research, AI analytics, and paper trading.
- Reduce fragmentation between charting, fundamentals, news, alerts, learning, and strategy testing.
- Provide an extensible academic and engineering foundation rather than a single-purpose demo.

System Architecture

- Next.js 16 frontend with React 19, TypeScript, Tailwind CSS, Radix UI primitives, Recharts, Zustand, Framer Motion, and lightweight-charts for interactive market visualization.
- FastAPI backend that exposes versioned REST APIs for authentication, user management, stocks, strategies, trading, alerts, community, and education workflows.
- Dedicated FastAPI ML microservice that handles feature engineering, price prediction, recommendation, risk analytics, fundamental analysis, backtesting, sentiment scoring, and AI chart-pattern detection.
- PostgreSQL with TimescaleDB-style time-series usage for market and OHLCV storage, supported by Alembic migrations and SQLAlchemy ORM models.
- Redis for caching, fast state lookups, and service-side infrastructure support.
- Docker Compose orchestration for frontend, backend, ML service, database, Redis, MLflow, and Flower.

Technology Stack

- Frontend: Next.js 16 app router, React 19 and TypeScript, Tailwind CSS 4, Radix UI and shadcn-style components, Recharts and lightweight-charts, NextAuth scaffold and local token storage flow, Framer Motion and tsparticles for interactive UI polish
- Backend: FastAPI, SQLAlchemy 2 async ORM, Alembic migrations, PostgreSQL / TimescaleDB usage pattern, Redis, python-jose for JWT handling, passlib with Argon2, sha256_crypt, and bcrypt support, slowapi for rate limiting, yfinance, pandas, numpy, ta
- ML Service: FastAPI ML microservice, PyTorch, scikit-learn, transformers, MLflow, OpenCV headless, Pillow, mplfinance, SciPy and custom algorithmic signal processing
- DevOps: Docker Compose, Dockerfiles per service, MLflow tracking container, Flower monitoring container, Container networking and mounted development volumes

Authentication and Security

- Access and refresh JWT tokens with explicit token type claims.
- Argon2 password hashing with compatibility fallbacks for legacy hash migration.
- Password policy requiring length, mixed case, numerics, and special characters.
- Breached-password screening using HaveIBeenPwned k-anonymity API logic.
- Failed-login tracking and temporary account lockout after repeated failures.
- User session recording with device fingerprint and IP address capture.

Frontend Modules

- Auth screens for login, register, password reset, and 2FA setup.
- Dashboard, portfolio, technical analysis, fundamentals, news, trading, strategies, backtest, risk, alerts, community, and learning routes.
- Reusable UI widgets including charts, ticker search, password strength meter, order book, and dashboard cards.

Backend Modules

- Versioned routers for auth, users, stocks, trading, strategies, alerts, social, and education.
- Service layer for alerts, broker simulation, stock data, education, and social flows.
- WebSocket layer for price, portfolio, and alert channels.

ML and AI Modules

- Feature engineering, risk analytics, LSTM forecasting, recommendation engine, and sentiment analysis.
- Fundamental scoring and DCF-style valuation support.
- Algorithmic plus CNN-transformer chart-pattern detection with annotation pipeline.

User Workflows

- User onboarding: A user registers with strong credentials, optionally configures 2FA, receives tokens, and enters the dashboard.
- Market research: The user searches Indian symbols, loads OHLCV data, studies indicators, checks quotes, reads news, and explores fundamentals.
- Technical analysis: The technical-analysis screen fetches candles, indicator overlays, quotes, and ML-backed chart-pattern findings.
- Paper trading: Trading logic validates buying power, updates positions, records transactions, and maintains order state.

Current Maturity

- The codebase contains a mix of production-style backend services and UI screens that are either API-integrated or still backed by representative mock data.
- Authentication, password reset, stock search, quotes, OHLCV retrieval, indicator calculation, alerts, community posting, education seeding, and several ML endpoints are implemented as concrete service flows.
- Some screens such as portfolio, trade, risk, and backtest currently render realistic demo data in the frontend while the backend and ML layers already expose foundations for fuller integration.
- The project uses legacy naming in places such as 'FinTech AI Platform' and older repository documents; this document set standardizes the academic/project title as FintechHQ, as requested.

Future Scope

- Live broker integration and fully wired frontend modules.
- Improved model lifecycle, experiment tracking, and validation.
- Production-grade secrets, observability, and cloud deployment.

Conclusion

- FintechHQ already demonstrates strong breadth across fintech, AI, and security engineering.
- Its modular design supports future growth without major architectural replacement.
- The project is suitable for academic presentation, viva, and technical review.
